### Child planning

a) Planning the gender of the child

Intercourse executed at the time range(s) determined by the table warrants a high possibility (98%) of conception of a child with the gender specified in the third column of said table. At times other than specified in the table, other methods of contraception must be used, which CANNOT BE oral contraceptives.

b) Elimination of primary infertility, not related to the reproductive organs

Intercourse executed at the times determined by the table yields the highest possibility of conception, but naturally, intercourse is not limited to the time frame determined by the table.

c) Elimination of secondary infertility, not related to the reproductive organs

Intercourse may be executed exclusively at times marked by double asterisks (\*\*) to allow highest possibility for conception of a healthy child. At times outside the predetermined timeframe, effective contraceptive device must be used, which cannot be oral contraceptives.
